SAFEHER · GOOGLE AI BUILDER CUP 2026

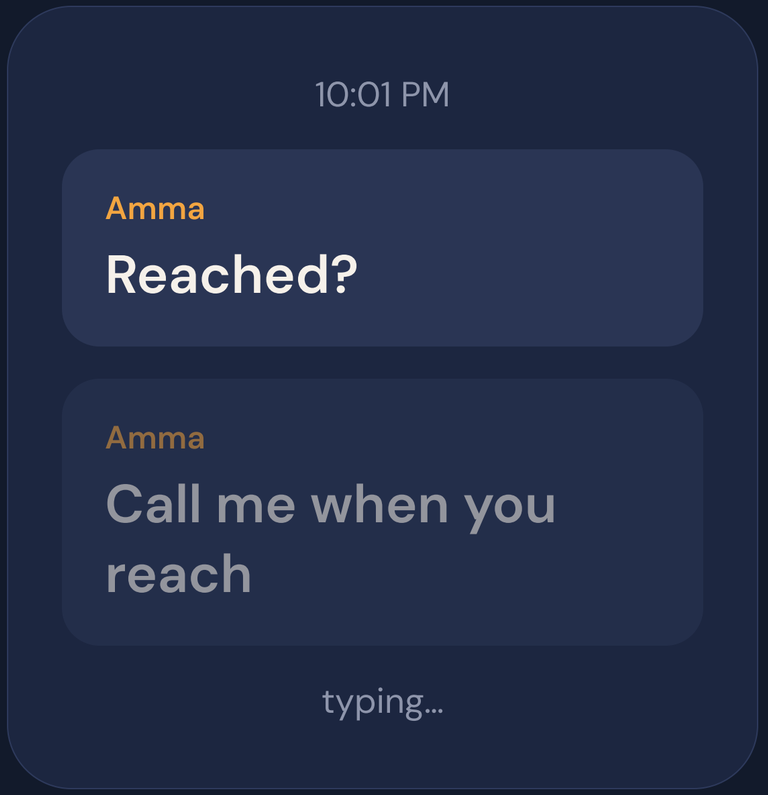

Reached?

The walk between the station and that one-word reply.
SafeHer shows what’s along it before she takes it.

MEERA, 24 · BENGALURU

10:00 PM. She steps out of Mahakavi Kuvempu Road metro. Her PG is 1 km away.

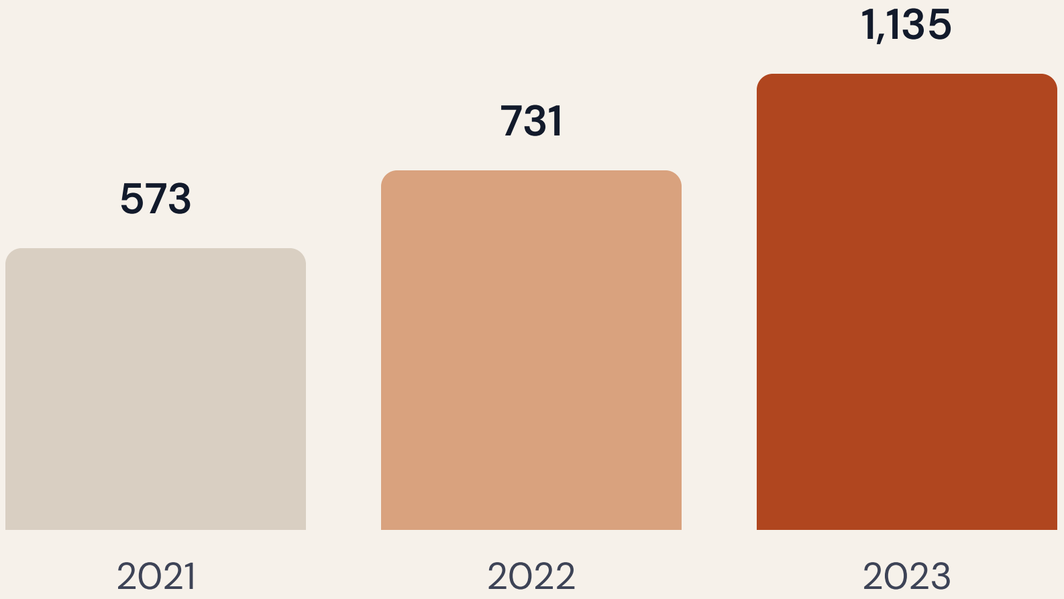

She moved from Mysuru for her first job. Her shift ends late. A map app says **12 minutes**. It doesn't say what those 12 minutes look like.

The worry is not imagined

1,135

molestation cases recorded by Bengaluru City Police in 2023, **nearly double the 573 in 2021**.

Source: Bengaluru City Police, Crime in Bengaluru 2023, via OpenCity (public domain). City-wide figures; SafeHer shows them as context and never uses them to score a street.

Maps answer *how fast*. At night she also needs to know what's along the way.

Is it lit?

Streetlights, lamps, the glow of the area from space

Are people around?

Shops, cafés, pharmacies still open at this hour; transit nearby

Where's help?

How far to a police station, hospital or open place if she needs one

MEERA'S WALK · 10:00 PM · REAL SAFEHER OUTPUT

Two extra minutes. A different walk home.

Shortest

12 min

66

- 13% of streets mapped as lit
- 10 places likely open on the way
- Help can be 5.4 min away

Most support

14 min

89

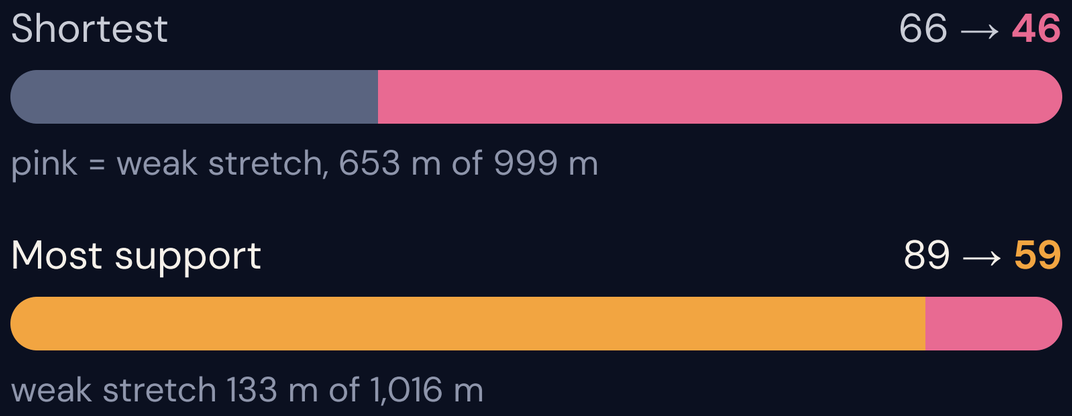

- **63%** of streets mapped as lit
- **33** places likely open on the way
- Help never more than **2.1 min** away

Mahakavi Kuvempu Road metro → Sri Vani Girls High School, Rajajinagar · about 1 km · scores out of 100

SAME WALK · 11:30 PM

The street didn’t change. The city around it did.

By 11:30 the shops are shut. On the shortest route, **653 m of the 999 m walk becomes a weak stretch**: few open places, no transit nearby.

Places likely open on the way: 10 → 4 on Shortest, 33 → 6 on Most support.

Opening hours from OpenStreetMap; where a place lists none, SafeHer assumes typical hours and says so.

HOW IT WORKS

Every 50 m of every route, five signals

Lighting

NASA Black Marble night lights, lit streets, mapped lamps

Open places

84,000 places with opening hours, at the time she walks

Transit

Metro and bus stops within 150 m

Past incidents

NCRB police-district data where published

Community

Reports from women: broken lights, harassment

Score = average of every stretch × 0.8 + the weakest 10% × 0.2. **One dark lane can’t hide behind a well-lit main road.**

NOTHING IS A BLACK BOX

Every point of the score traces back to data she can open

Tap *How is this calculated?* and see the formula with this route's own numbers, where each signal came from, and the lamps, stops and open places that were counted.

Gemini writes it in words. Code checks every word.

- Every number must exist in the route data
- Every place named must be on the route
- Never “safe”, “unsafe” or “dangerous”
- Fails twice? She sees an error, never a made-up answer

HERSIDE · GEMINI 2.5 ON VERTEX AI

A companion that answers about her walk, and only her walk

“Is the longer route worth 2 minutes?”

Answers from SafeHer’s own calculations: the scores, the lit share, the open places.

“Which cafés near her PG stay open after 11 pm?”

Grounded with **Google Maps**, with sources listed and a “Show on map” card.

“Recommend a movie for tonight?”

Politely declines. A Gemini 2.5 Flash-Lite guardrail keeps it on walking safety, and fails closed.

WHILE SHE WALKS

Amma watches the dot move. Meera decides when it stops.

Live sharing

A private link, no app to install. Only the latest position is kept, no history. Expires in two hours.

Plan B

On every route, the longest walk to a place likely to be open, measured along streets, not as the crow flies.

I don’t feel safe

One tap to 112. No AI in the way, ever.

LIVE TODAY

Two whole cities, not a demo neighbourhood

1.6M
street segments across Delhi and Bengaluru

84K
places with opening hours

52K
km of walkable streets scored

₹0
running cost while nobody is using it

Open data (OpenStreetMap, NASA, NCRB, Bengaluru police) in one 145 MB file · Cloud Run that scales to zero · Firebase Hosting · Firestore · Gemini 2.5 on Vertex AI · deployed on every merge by GitHub Actions.
A new city is one config entry and a rebuild.

RESPONSIBLE BY DESIGN

Honest about what data can and can’t tell her

Never promises safety

“More support”, “better lit”, “weak stretch”. Never “safe” or “dangerous”, enforced in code.

Says when it’s guessing

Estimated lighting and assumed opening hours are labelled. Low-confidence data says so.

Doesn’t stigmatise areas

City-wide crime figures are context only. They never colour a street they can’t be tied to.

Her location stays hers

Sharing is opt-in, keeps no history and ends when she says. Route explanations never see her live GPS.

WHAT'S NEXT

From two cities to every walk home

Richer evidence

Street-level incident data from Safecity (requested); more community reports.

More cities

Mumbai, Hyderabad, Pune, Chennai: each one config entry and a data rebuild.

Where women already are

[Partners: PG operators, colleges, employers with late shifts]

Not the fastest way home. The one with more light, more people and more help along it.
